# The Mountain Ecosystem

By Kimberly M. Hutmacher

A habitat is where a plant or animal lives and grows. A habitat is part of an ecosystem where lots of different plants and animals live. Mountains, with their many levels, are an ecosystem containing many different habitats.

underneath a leaf to hide. Goats might be leaping from rock to rock.

Climb even higher, toward the top, and you'll notice a change in the temperature. It's getting colder and snow is covering the mountaintops. There aren't many plants near the mountaintop, but you might see fuzzy lichen covering rocks like carpeting. The air is thin at the top of the mountain, which makes it difficult for large animals to breathe. When people climb very large mountains, they often take special air tanks filled with oxygen. Even though you won't see many big animals, millions of tiny insects like snow fleas might dot the landscape.

Depending on the elevation, you could see deserts, river valleys, meadows, forests, and snow caps all on one mountain. With each unique habitat comes unique plant and animal life.

**Mountains probably don't have lakes near the top because gravity pulls the water downwards, through streams or rivers, to the base of the mountain.**
