# Master of the Grasses

by Guy Belleranti

What would you do if you saw a guinea pig that weighed 75, 100 or even 150 pounds? Of course, guinea pigs don't grow nearly that big, but if you saw a capybara, you might mistakenly think it was a giant guinea pig.

The largest species has ears, and

world's smallest

The name "capybara" means "master of the grasses". You see, capybaras are vegetation eaters, and grasses are the main food in their diets. Capybaras have two pairs of large incisor teeth to bite off grasses, tree bark, and other vegetation. Most animals have teeth that stop growing, but rodents like the capybara have a different kind of teeth. Their incisors keep growing longer and longer throughout their entire life. They need to file their teeth down on hard plants like trees bark to keep them from growing too long.

Capybaras are social animals and live in large groups. A mother capybara gives birth to up to six babies at a time, though the average number of babies is four.

Capybaras can run, jump in long leaps and swim. In fact, they spend lots of time in the water, and even have webbed feet to help them swim. The water keeps capybaras cool during the hot day, and it provides aquatic plant food. They also use the water for protection. They can submerge below

the surface to hide from predators such as jaguars, anacondas, and ocelots. A capybara's eyes, ears and nostrils are near the top of their head. This helps them breathe and keep watch for predators while swimming underwater. Still, they
