By Guy Belleranti

Have you ever heard of the alligator snapping turtle? This prehistoric-looking reptile, which lives in the rivers, swamps, and lakes of the southeastern United States, is sometimes called the "dinosaur of the turtle world." Looking at a picture of the alligator snapping turtle, it's not hard to see why!

It is rare for an alligator snapping turtle to leave its watery home. One of the few times you might find one of these turtles on land is when the females come out of the water to dig a nest for their eggs. In fact, the turtles spend so much time in the water that algae can grow on their shells, providing camouflage.

During the daytime, alligator snapping turtles hide underwater, coming up every 40 to 50 minutes to breathe. Underwater, the turtles keep their mouths open, luring their prey close with a pink, worm-like appendage on their tongue. Then... snap! The alligator snapping turtle either slices its prey in half or swallows it whole. Fish, frogs, worms, snails, snakes, clams, crayfish, and other turtles are on the menu for the alligator snapping turtle. It also eats aquatic plants. At night, the alligator snapping turtle becomes more active, walking slowly in its underwater habitat in search of food. Tasting chemicals in the water, the turtle can find nearby prey.

The adult turtles do not protect their young. Raccoons, birds, and large fish prey on
