A reef is a shallow underwater area made of coral. Many fish and sea animals live in and around reefs.

Let’s talk more about these little coral polyps. Like all animals, coral polyps need to eat. Their diet consists mainly of other miniscule animals, such as plankton and algae. The algae get their food from the sun. Because sunlight can only penetrate shallow water, the algae and coral polyps live in shallow water. This is where coral reefs generally form. A wide variety of animals live in coral reefs. Some animals live on the actual reef, like starfish, snails, and clams. Other species swim around the reef, like fish and sharks.
There are three types of coral reefs. Fringing reefs form along a coastline. Barrier reefs grow a bit farther from the land. They form parallel to the shore, separated from it by a deep channel of water. Finally, coral atolls are coral reefs that encircle a lagoon.

Coral reefs exist all around the world. The biggest one is called the Great Barrier Reef. The Great Barrier Reef is located off the northeast coast of Australia. It is very long, stretching out for 1,429 miles (2,300 km). It can even be seen from outer space! Every year, the beautiful Great Barrier Reef attracts many scuba divers.

Coral reefs are a vital part of our planet. First of all, they are a home for many animals. They also protect shorelines against storms and floods. They can even provide us with the natural resources we need to make some kinds of medicine. However, a serious problem is occurring: many coral reefs are dying. Pollution and overfishing are the main causes. And since coral reefs take a very long time to grow, they cannot grow fast enough to replace the damage. As a result, the coral reefs around the world are starting to disappear. Some scientists predict that someday soon most of the coral reefs will be gone. That is why we have to take good care of them. We should do our best to protect these incredible living communities for generations to come!
Coral Reef: The Ocean’s Coolest Neighborhood

By Lydia Lukidis

1. Describe the rate at which coral reefs grow.

________________________________________________________________________________
________________________________________________________________________________

2. Why are coral reefs found mostly in shallow water?
   a. Coral reefs thrive in shallow water because the sunlight penetrates the water and provides food for the algae that coral polyps eat.
   b. Coral reefs are protected in shallow water from damage by huge ocean animals like whales and great white sharks.
   c. Coral reefs cannot survive the saltiness of deep ocean water.
   d. Coral reefs cannot endure the currents in deep ocean water.

3. Circle the two hemispheres that the Great Barrier Reef is located within.
   Northern  Southern  Eastern  Western

4. Based on the information in the article, provide a brief definition of each of the three types of coral reefs.

   fringing reef: ___________________________________________________________________
   __________________________________________________________________________________

   barrier reef: ________________________________________________________________
   ______________________________________________________________________________

   coral atoll: ________________________________________________________________

<tr>
<td>lagoon</td>
<td>a number of different things</td>
</tr>
</tbody>
</table>
In the article, “Coral Reef: The Ocean’s Coolest Neighborhood,” you learned that coral reefs are very important for the well-being of our planet. On the lines below, describe some of the ways that coral reefs benefit the environment. Then describe what you think might happen if all the coral reefs of the world disappear from damage, pollution, and climate change. Finally, give one suggestion for protecting the coral reefs.

Coral Reef: The Ocean’s Coolest Neighborhood
By Lydia Lukidis

Coral reefs grow extremely slowly, at a rate of about 1 to 2 cm per year.

Fringing reefs form along the coastline.

Coral atolls form around a lagoon like a circle.

Barrier reefs form parallel to the shore, with a channel of water running between.

Coral atolls form around a lagoon like a circle.
Coral Reef: The Ocean’s Coolest Neighborhood

By Lydia Lukidis

1. ______ variety

2. ______ tourists

3. ______ formation

4. ______ encircle

5. ______ pollution

6. ______ vital

7. ______ miniscule

8. ______ channel

9. ______ predict

10. ______ lagoon

---

9. c predict

i. a long passage of water

10. e lagoon

j. a number of different things
