# Dolphins and Porpoises

By Guy Belleranti

Porpoises and dolphins are fascinating and beautiful sea creatures. They are in the group of whales called toothed whales.

Many people think dolphins and porpoises are fish, but this is simply not true. They are mammals, just like dogs, cats, horses, cows, deer, and humans. Like all

Most porpoises and dolphins eat fish, squid, and crustaceans. However, the largest species of dolphin, the orca, also hunts seals, penguins, walruses, and whales.

Both porpoises and dolphins use echolocation. This means they send out sounds and then listen for the echoes bouncing back. Echolocation helps them find food and escape predators.

Both porpoises and dolphins are toothed whales. However, porpoise teeth are shaped differently than dolphin teeth. Dolphins have sharp, cone-shaped teeth, but porpoise teeth are spade-shaped and flatter.

Their bodies are shaped differently too. Porpoises are shorter with more rounded beaks and bodies. The dorsal fins on their backs are also shorter and

less pointed. Dolphins, on the other hand, have longer, more pointed beaks. Their dorsal fins are taller and more pointed too.

Porpoises are usually under 7 feet (2 meters) long. Many dolphins are over 10 feet (3 meters). Orcas can grow over 20 feet (6 meters) long.

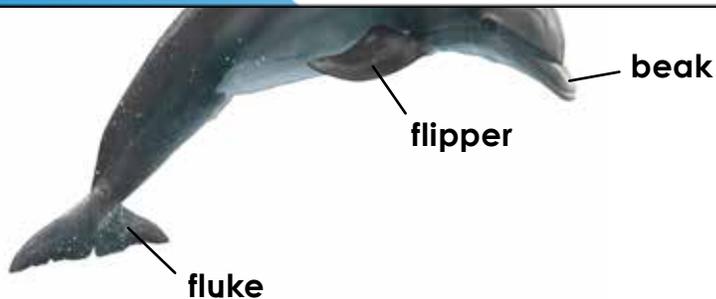

The life span of a dolphin is usually much longer than the life span of a porpoise. Dolphins can live 50 or more years. Porpoises seldom live longer than 15 years.

Dolphins are very social animals. They live in large groups called pods, with up to 30 individuals. Dolphins enjoy interacting with humans. Sometimes they swim beside boats and make whistling and chirping sounds as they talk. Porpoises are much more shy than dolphins, and they tend to avoid human
