My hiking partner and I are trekking through Montana’s Glacier National Park. Suddenly, we stop in our tracks. On the trail just ahead, a grizzly bear cub is scratching on a tree trunk. The cub’s mother stands beside it. I feel awe, then a little fear. Getting this close to a grizzly, especially a mother and cub, is very dangerous. We quietly back up and go the other direction.

Grizzlies are a North American subspecies of brown bear. Most are a medium brown color, but some are much lighter while others are almost black. A second North American brown bear subspecies is the Kodiak brown bear. The Kodiak lives in a part of coastal Alaska where there are many fish to eat. Some Kodiaks get huge, about the size of polar bears.

Brown bears live in more habitats than any other bear. Some, like the Kodiak, live by the coast. Others, like the grizzly, live in forests and mountain meadows. Some even live in the Arctic tundra.

At one time, brown bear territory included most of North America, Asia, Europe, and the Middle East. Unfortunately, habitat loss, overhunting, and killing out of fear have reduced their numbers. Today, North American brown bears are primarily in Alaska and western Canada. A few northwestern U.S.
states still have some as well, especially in or near national parks and other protected areas.

Brown bears are omnivores. They eat plants, nuts, berries, insects, rodents, fish, deer, and even carrion (dead animals). The bears' eating habits have an important impact in the ecosystem where they live. They carry seeds to other locations in their scat (waste) and fur. They also help keep deer and other animal populations under control.

Some people get brown bears and black bears confused because brown bears aren’t always brown and black bears aren’t always black. So how can you tell them apart? Well, brown bears are larger and have a muscular shoulder hump. They also have longer and straighter claws. The hump and claws provide strength,

spawning fish. They also come together to breed.

And, of course, mothers spend large amounts of time with their cubs. Mothers have one to four cubs, but most often two. The cubs are born blind, hairless, and tiny. They weigh only about one pound. They sleep next to their mother and grow quickly from her milk. After two to three years, they are ready to live on their own.
Brown Bears

By Guy Belleranti

1. According to the information in the article, how can you identify a brown bear from a black bear in the wild?
   a. A brown bear is always brown and a black bear is always black.
   b. A brown bear has a muscular shoulder hump and longer claws.

2. Where do brown bears live today?
   a. along the Alaskan coastline
   b. in national parks in the western U.S. and Canada
   c. in the Arctic tundra
   d. all of the above

3. Based on what you read in the article, why are there fewer brown bears in existence today than in the past?

________________________________________________________________________________

________________________________________________________________________________

4. When do brown bears spend time in the company of other brown bears?
   a. when they are feeding on schools of spawning fish
   b. when they bathe in rivers and streams
   c. when they produce and care for their young
   d. both a and c

5. Why isn’t it a good idea to approach a brown bear cub if you see one?

Match each vocabulary word from the reading passage with the correct definition.

1. ____ meadows
   a. hiking or walking

2. ____ ecosystem

3. ____ solitary

4. ____ trekking

5. ____ omnivores
   e. laying eggs

6. ____ tundra
   f. defended against danger or harm

7. ____ subspecies
   g. a community of living things interacting with their environment

8. ____ protected
   h. the edge of land that meets the sea

9. ____ spawning
   i. animals that eat both plants and other animals for food

10. ____ coast
    j. spending time alone
In the article, “Brown Bears,” you learned that in the past, brown bears lived throughout most of North America, Asia, Europe, and the Middle East. Today there are fewer brown bears because their populations have been reduced by habitat loss, overhunting, and killing out of fear. Now brown bears can mostly be found in and around national parks.

On the lines below, describe three ways humans can continue to protect brown bear populations today.

5. Why isn’t it a good idea to approach a brown bear cub if you see one?

A mother brown bear is always nearby her cubs and she can become dangerous if you approach her young.
Brown Bears

Match each vocabulary word from the reading passage with the correct definition.

9. e. spawning
   i. animals that eat both plants and other animals for food

10. h. coast
    j. spending time alone
