

Name: _____

Echidnas

By Guy Belleranti

What mammal has spines like a hedgehog, a snout like an anteater, and lays leathery eggs like a reptile? The echidna or spiny anteater. Even though it looks like a cross between an anteater and a hedgehog, the echidna isn't closely related to either of these animals. Actually, its closest relative is the duck-billed platypus.

The echidna and platypus are the only remaining members of a primitive group of mammals called monotremes. You were probably taught that mammals do not lay eggs because their babies are born alive. While this is true for most mammals, monotremes are a little different. Monotremes are the only mammals that lay eggs.

Echidnas live mainly on the Australia's mainland, but some are also found on the nearby islands of Tasr

In addition to living in burrows some echidnas also live in hollow logs and under thick bushes. The echidna has hair, but no spines, on its belly, legs and face. However, when it rolls up the spines on its back and sides cover the animal completely.

Echidna moms lay only one egg a year. The egg is tiny, about the size of a grape. The mother keeps the egg protected in a pouch on her belly. After 10 days the egg hatches. The baby echidna is called a puggle. The puggle licks up milk oozing from glands in the mother's pouch.

When the puggle's spines begin to grow the mother puts it in a burrow. The mother returns to feed her young every five to ten days. Once the young echidna is seven months old it is able to live on its own.

Name: _____

Echidnas

By Guy Belleranti

1. Echidnas are native to...
- a. the Southern Hemisphere
 - b. the Indian subcontinent
 - c. Argentina
 - d. Antarctica

2. Besides echidnas, what other species of mammals lay eggs?

3. Name four things that an echidna eats.

4. How are echidnas and kangaroos similar?

- a. They are both monotremes.

5.

4. _____

5. _____

y s p t u l a p

hint: one of only two mammals that lay eggs

6. _____

r w o s e h a r t m

hint: underground animals with no arms or legs

7. _____

u s i c d i o e l

hint: tasty; yummy

ANSWER KEY

Echidnas

By Guy Belleranti

1. Echidnas are native to... **a**
- a. **the Southern Hemisphere**
 - b. the Indian subcontinent
 - c. Argentina
 - d. Antarctica

2. Besides echidnas, what other species of mammals lay eggs?

platypus

(Note: Monotremes is an incorrect answer because they are not a species, but rather a category of animals.)

3. Name four things that an echidna eats.

ants, termites, grubs, and earthworms

4.
