Name:

Giant Pandas

By Guy Belleranti

Black and white giant pandas are much loved in their native China and around the rest of the world.

Sadly, they're also a very endangered animal. Much of their forest habitat has been cleared for farms, roads, railroads, and other development. The 1,500

in the torests, and a lot of it – 25 to 40 pounds (11 to 18 kg) every day! Glant pandas must eat more than one kind of bamboo because the plants are low in

nutrients. They will eat other plants, and even meat occasionally, but bamboo makes up 99% of their diet.

Giant pandas eat by gripping bamboo stems in their front paws and sitting upright, kind of like a person. Each paw's grip is aided by an extra long flesh-covered wrist bone that acts like a thumb.

Most of the time, giant pandas are loners. However, when they come together, they're the most vocal of all bears. They bleat, bark, huff, and growl

during their very short breeding season. Cubs squeal and croak when they're with their mothers.

Pandas also communicate by leaving scent markings from glands under their tails. Males find breeding females by scent. Males also sometimes do "hand stands" so they can leave their scent higher up a tree.

Giant panda mothers give birth to one, or sometimes two, tiny cubs. If two cubs are born, only the stronger cub usually survives. Males do not help with the

care. The cubs are mostly hairless and only weigh ¼ of a pound (.11 kg). That's 800 times smaller than its 200-pound (90 kg) mother!

Giant Pandas

By Guy Belleranti

In the article, "Giant Pandas," you learned that pandas live in a very restricted mountainous habitat in China, where they can find the bamboo that makes up 99% of their diet. In fact, there are only around 1,500 giant pandas left in the wild.

Why do you think there are so few pandas left in the wild? Is there anything that
