Name: _____

Master of the Grasses

By Guy Belleranti

What would you do if you saw a guinea pig that weighed 75, 100, or even 150 pounds? Of course, guinea pigs don't grow nearly that big, but if you saw a capybara, you might mistakenly think it was a giant guinea pig.

The capybara, which lives in South and Central America, is the world's largest species of rodent. It has a barrel-shaped body, webbed feet, and a blunt head. Two pairs of incisor teeth to bite off grasses, tree bark, and other vegetation. Most animals have teeth that stop growing, but rodents like the capybara have a different kind of teeth. Their incisors keep growing longer and longer throughout their entire life. They need to file their teeth down on hard plants like trees' bark to keep them from growing too long.

Capybaras are social animals and live in large groups. A mother capybara gives birth to up to eight babies at a time. Capybaras love water. They spend most of the hot day, and it provides aquatic plant food. They also use the water for protection. They can submerge below the surface to hide from predators such as jaguars, anacondas, and ocelots. A capybara's eyes, ears and nostrils are near the top of their head. This helps them breathe and keep watch for predators while swimming underwater. Still, they have to be alert at all times because many of its enemies are good hunters in water. When danger is near, capybaras can dive deep to the bottom of a riverbed and hold their breath for five minutes before returning to the surface for air.

The capybara is the world's largest species of rodent and can weigh up to 150 pounds.
