

Name: _____

Groundhog or Woodchuck?

by Kelly Hashway

What's the difference between a groundhog and a woodchuck? Actually, they are the same animal. Groundhogs are also known as woodchucks and even marmots.

Groundhogs are the largest members of the squirrel family. They are a member of a special group of ground squirrels called

marmots. Groundhogs may not look like they would be good climbers, but they are. Even with their heavy looking bodies, they can climb trees to escape predators or check out their

groundhogs prefer to be in burrows under the ground, which is where they make their homes. A burrow usually has anywhere from two to five exits to help the groundhog escape predators. Luckily, groundhogs have very strong limbs and curved claws that make digging easy. Once a burrow is made, the groundhog will stay close to it. This is why they make their burrows near

sources of food. Groundhogs eat mostly wild grass and other vegetation. But they do eat small animals like grasshoppers, snails, and grubs, too.

While groundhogs will eat nuts like squirrels do, they do not store food the same way. Groundhogs will eat and eat all summer long to build up fat in their bodies. Once the weather starts getting cold, they hibernate like bears in underground burrows.
